

## ITEM SCORING CUSTOM OPERATORS

### Revision History

Revision Description	Author/Modifier	Date
0.1 - First Draft Release	Jon Cohen Balaji Kodeswaran David Lopez de Quintana	November 17, 2014
0.2 – Added four additional EQ custom operators	Balaji Kodeswaran David Lopez de Quintana	November 19, 2014
0.3 – Added QTI 3 reference along with edits to bring document up to date with existing item types.	Alex Dean	June 26, 2023

## Introduction

### Overview

The SmarterApp items are divided into three categories based on how they are scored:

1. Human scored: SA (short answer) and WER (writing extended response) items are intended to be human scored, so no machine scoring rubrics are provided for these item types.
2. Trivially scored: MC (multiple choice) and MS (multi-select) items are scored by comparing a student's response with the "correct" response captured in the item XML itself.
3. Machine scored: EBSR (evidence-based selected response), HTQS (hot text selectable) and MI (match interaction) items provide external scoring machine rubric files that are scored using QTI response processing.
4. Machine scored with custom operators: EQ (equation), GI (grid) and TI (table interaction) item types that are scored using QTI response processing that is extended by custom operators. QTI provides a means of extending default response processing via custom operators as a mechanism.
5. Probabilistically scored: WER items containing essays can be scored with an open source essay scoring engine. However, unlike other machine scored items that use a scoring engine to deterministically score any compliant machine rubric, these items require a special machine rubric that is created by "training" the scoring engine with a training set of items that have been previously human scored. This type of item scoring is considered probabilistic as opposed to deterministic because (a) there must be a training process, and (b) the exact scores produced by this type scoring engine for a given student response cannot be predicted based on the contents of a rubric file, but is instead dependent on the training set used and the quality and accuracy of the human scores of the training set.

This document focuses on number 4 above, machine scored items with custom operators. It describes the custom operators used to score EQ, GI and TI item types. General QTI response processing is outside the scope of this document as this is well documented in various QTI standards (see reference 2).

### CTRL Custom Operators

This section details general custom operators that are not specific to Grid (GI), Table Interaction (TI) and Equation (EQ) Equation item types. All custom operators in this section are of type = CTRL.

#### mapExpression

Custom Operator	Description
Function Name	mapExpression
Function Description	This applies the contained expressions to each element sequentially to each element of the collection identified in “container.” All expression must return a Boolean value. Note that the symbol “@” can be used by expressions to reference each element in the set
Return Type	Container
Return Description	A container with the same basetype as the input container and an ordered cardinality

Attributes	Type	Description
container	Identifier	an identifier bound to a value with cardinality multiple or ordered

#### stringToFloat

Custom Operator	Description
Function Name	stringToFloat
Function Description	Parses a string and converts it to a floating point value
Return Type	Float
Return Description	A numerical value based on parsing of the input string, or NaN if the parse fails

Attributes	Type	Description
inputString	String	A string formatted as a numerical value

#### COUNTDOUBLEINRANGE

Custom Operator	Description
Function Name	COUNTDOUBLEINRANGE
Function Description	Takes a collection or comma-separated list of numeric values and counts the number of values within the specified range
Return Type	Integer

Custom Operator	Description
Return Description	The number of doubles in the specified range

Attributes	Type	Description
List	String or identifier	either: 1) a list of values consisting of parseable numeric values or numeric variable identifiers prefaced with a "\$", or 2) an identifier bound to a variable with basetype float or integer
Min	Float	minimum value included in the range
Max	Float	maximum value included in the range

## COUNTBOOL

Custom Operator	Description
Function Name	COUNTBOOL
Function Description	Takes a collection or list of Boolean values and counts the number that are either true or false
Return Type	Integer
Return Description	The number of values that are specified

Attributes	Type	Description
List	String or identifier	either: 1) a list of values consisting of parseable Boolean values or Boolean identifiers prefaced with a "\$", or 2) an identifier bound to a variable with basetype Boolean
booleanValue	Boolean	true or false. The value to be matched.

## MAXINT

Custom Operator	Description
Function Name	MAXINT
Function Description	Returns the maximum value of a set of integers
Return Type	Integer
Return Description	An integer representing the maximum value in the set if integers provided

Attributes	Type	Description

Attributes	Type	Description
List	string or identifier	either: 1) a list of values consisting of parseable integer values or integer variable identifiers prefaced with a "\$", or 2) an identifier bound to a variable with basetype integer

## MININT

Custom Operator	Description
Function Name	MININT
Function Description	Returns the minimum of a set of integers
Return Type	Integer
Return Description	The minimum value of a set of integer values

Attributes	Type	Description
List	string or identifier	either: 1) a list of values consisting of parseable integer values or integer variable identifiers prefaced with a "\$", or 2) an identifier bound to a variable with basetype integer

### GRID Item Custom Operators

This section describes the custom operators used in response processing of SmarterApp Grid (GI) item type rubrics. All custom operators in this section are of type = GRAPHIC.

#### PREPROCESSRESPONSE

Custom Operator	Description
Function Name	PREPROCESSRESPONSE
Function Description	Translates graphic responses to a collection of strings representing the objects in the set
Return Type	basetype
Return Description	A basetype “string” with cardinality “ordered”

Attributes	Type	Description
Response	identifier	names the original XML response to be preprocessed

#### COUNTSIDES

Custom Operator	Description
Function Name	COUNTSIDES
Function Description	Counts the number of line segments that comprise the object
Return Type	Integer
Return Description	an integer representing the number of sides of the object. If the object passed in was not a graphic object or it was not an object comprised of line segments, zero is returned

Attributes	Type	Description
object	identifier	identifier bound to a string representing a graphic object

#### GETPOINT

Custom Operator	Description
Function Name	GETPOINT
Function Description	Gets a point object corresponding to the location of a point or atomic object in the response space
Return Type	Point

Custom Operator	Description
Return Description	A point in the response space, or null if an inappropriate object was passed in

Attributes	Type	Description
object	Identifier	Identifier bound to a string representing a point or an atomic object
pointIndex	Integer	The index of the specified point

## INTERSECTSREGION

Custom Operator	Description
Function Name	INTERSECTSREGION
Function Description	Checks whether an object intersects a rectangular region. For usability reasons intersection is defined as within 5 pixels
Return Type	Boolean
Return Description	Boolean indicating whether the object intersected the region

Attributes	Type	Description
object	identifier	identifier bound to a string representing a graphic object
topY	Integer	top of the region
leftX	Integer	leftmost part of the region
bottomY	Integer	bottom of the region
rightX	Integer	rightmost part of the region

## ISREGIONSELECTED

Custom Operator	Description
Function Name	ISREGIONSELECTED
Function Description	Determines if a region is selected
Return Type	Boolean
Return Description	Returns true if the region is selected, false otherwise

Attributes	Type	Description

Attributes	Type	Description
region	Identifier	Identifier bound to a string representing a region

### GETSELECTEDREGIONSCOUNT

Custom Operator	Description
Function Name	GETSELECTEDREGIONSCOUNT
Function Description	Returns the quantity of the regions within a region group that are selected
Return Type	Integer
Return Description	The number of selected regions within a region group

Attributes	Type	Description
regionGroup	Identifier	Identifier bound to a string representing a region group

### GETSLOPE

Custom Operator	Description
Function Name	GETSLOPE
Function Description	Calculates the slope of a line
Return Type	Float
Return Description	A value representing the slope of the line. Returns NaN if the object is not a line.

Attributes	Type	Description
vector	Identifier	Identifier bound to a string representing a line

### GETVECTOR

Custom Operator	Description
Function Name	GETVECTOR
Function Description	Returns the index-th vector of a multi-vector object. Vectors are sorted starting with the vector containing the top-most, left-most point, and moving clockwise. Where more than two line segments meet at the same point, the top-most, left-most comes first.
Return Type	String
Return Description	A string representation of the vector

Attributes	Type	Description
Order	Integer	Index of desired vector
Object	Identifier	Identifier bound to a string representing a graphic object

### ISGRAPHICTYPE

Custom Operator	Description
Function Name	ISGRAPHICTYPE
Function Description	Determines if the object is a graphic object of the identified type
Return Type	Boolean
Return Description	Returns true if the graphic object is an object of the identified type

Attributes	Type	Description
Object	identifier	identifier bound to a string representing a graphic object
graphicType	string	must be one of the following: "PALETTEIMAGE", "VECTOR", "ARROW", "POINT"

### GETLENGTH

Custom Operator	Description
Function Name	GETLENGTH
Function Description	Returns the length of the referenced vector
Return Type	Float
Return Description	A value indicating the length of the vector or NaN if anything but a vector is provided

Attributes	Type	Description
vector	identifier	Identifier bound to a string representing a vector.

### GETNAME

Custom Operator	Description
Function Name	GETNAME

Custom Operator	Description
Function Description	Returns the name of a named graphic object
Return Type	String
Return Description	The name of the graphic object or an empty string if the graphic object is unnamed

Attributes	Type	Description
Object	Identifier	Identifier bound to a string representing a graphic object

## INTERSECTSPOINT

Custom Operator	Description
Function Name	INTERSECTSPOINT
Function Description	Determines if the object intersects the designated point
Return Type	Boolean
Return Description	Returns true if the object intersects the designated point, false otherwise

Attributes	Type	Description
Object	Identifier	Identifier bound to a string representing a graphic object
X	Integer	x coordinate of the point to check the intersection against
Y	Integer	y coordinate of the point to check the intersection against
Tolerance	Float	Allowable distance from the point still considered intersecting in the same units used in the coordinate plane of the item

## HASVERTEX

Custom Operator	Description
Function Name	HASVERTEX
Function Description	Determines if a point is among the vertices of an object
Return Type	Boolean
Return Description	Returns true if the point (x,y) is among the vertices of the object, false otherwise

Attributes	Type	Description

Attributes	Type	Description
object	identifier	identifier bound to a string representing a graphic object
tolerance	float	allowable distance from the point still considered intersecting in the same units used in the coordinate plane of the item

### TABLE Item Custom Operators

This section describes the custom operators used in response processing of SmarterApp Table Interaction (TI) item type rubrics. All custom operators in this section are of type = TABLE.

#### GETCOLUMN

Custom Operator	Description
Function Name	GETCOLUMN
Function Description	Obtains the requested column
Return Type	String
Return Description	A string representing the requested column. The string may be empty

Attributes	Type	Description
table	Identifier	identifier bound to a string representing a table
columnName	String	the name of the desired column

#### GETHEADERROW

Custom Operator	Description
Function Name	GETHEADERROW
Function Description	Obtains the header row of the table
Return Type	String
Return Description	A string representing the requested header row. The string may be empty

Attributes	Type	Description
table	identifier	identifier bound to a string representing a table

#### GETVALUENUMERIC

Custom Operator	Description
Function Name	GETVALUENUMERIC
Function Description	Obtains the numeric value of the indicated cell

Custom Operator	Description
Return Type	Float
Return Description	The numeric value of the indicated cell or NaN if the value cannot be successfully parsed

Attributes	Type	Description
tableVector	Identifier	identifier bound to a string representing a table
index	Integer	the index of the desired cell

## EQUATION Item Custom Operators

This section describes the custom operators used in response processing of SmarterApp Equation (EQ) item type rubrics. All custom operators in this section are of type = EQ.

### PREPROCESSRESPONSE

Custom Operator	Description
Function Name	PREPROCESSRESPONSE
Function Description	Translates equation responses to a collection of strings representing the objects in the set
Return Type	Basetype
Return Description	A basetype “string” with cardinality “ordered”

Attributes	Type	Description
Response	identifier	names the original XML response to be preprocessed

### ISEQUIVALENT

Custom Operator	Description
Function Name	ISEQUIVALENT
Function Description	Compares the equation expression to an exemplar and determines if they are equivalent
Return Type	Boolean
Return Description	Returns true if the equation referenced by object is equivalent to the exemplar

Attributes	Type	Description
Object	Identifier	identifier referencing a string representing a mathematical expression
exemplar	String	string representing a mathematical expression of an exemplar
simplify	Boolean	Flag indicating that simplifications can be performed (e.g. $1+1=2$ )

### ISEQUIVALENTLOG

Custom Operator	Description
Function Name	ISEQUIVALENTLOG

Custom Operator	Description
Function Description	Compares the equation expression to an exemplar and determines if they are equivalent using properties of Logs
Return Type	Boolean
Return Description	Returns true if math expression object is equivalent to exemplar expression using properties of Logs

Attributes	Type	Description
Object	identifier	identifier referencing a string representing a mathematical expression
exemplar	string	string representing a mathematical expression of an exemplar
assumptions	Boolean	Flag indicating that bases are positive and exponents are real

### ISEQUIVALENTTRIG

Custom Operator	Description
Function Name	ISEQUIVALENTTRIG
Function Description	Compares the equation expression to an exemplar and determines if they are equivalent using Trig identities
Return Type	Boolean
Return Description	Returns true if math expression object is equivalent to exemplar expression using Trig identities

Attributes	Type	Description
object	Identifier	identifier referencing a string representing a mathematical expression
exemplar	String	string representing a mathematical expression of an exemplar

### ISEMPTY

Custom Operator	Description
Function Name	ISEMPTY
Function Description	Determines if a math expression is empty
Return Type	Boolean
Return Description	Returns true if math expression object is empty

Attributes	Type	Description

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression

### NUMBERFROMEXPRESSION

Custom Operator	Description
Function Name	NUMBERFROMEXPRESSION
Function Description	Converts the math expression object to a number
Return Type	double
Return Description	Returns the numerical value represented by the math expression or Double.NaN if the expression cannot be parsed

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression whose value is of interest

### GETINEQUALITIESCOUNT

Custom Operator	Description
Function Name	GETINEQUALITIESCOUNT
Function Description	Determines the number of inequalities in a math expression
Return Type	Integer
Return Description	Returns the number of inequalities in a math expression object

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression

### ISMATCH

Custom Operator	Description
Function Name	ISMATCH
Function Description	Determines if an expression can be matched to a parameterized pattern
Return Type	Boolean
Return Description	Returns true if expression can be matched by the given parameterized pattern

Attributes	Type	Description
object	identifier	identifier referencing a string representing an expression to be matched to a given pattern
pattern	string	A string representing a mathematical expression
parameters	string	Comma-separated parameters in the pattern (e.g. a,b,c)
constraints	string	Comma-separated constraints on parameter values (e.g. a>=1 and a<4, b==1 or b==2, c!=0)
variables	string	Comma-separated variables in the pattern (e.g. x,t)
simplify	Boolean	Flag indicating that simplifications can be performed (e.g. 1+1=2)

### LINECONTAINS

Custom Operator	Description
Function Name	LINECONTAINS
Function Description	Returns true if line contains an expression equivalent to exemplar expression. For ex, LineContains(8+8+8=24-2=2, 24-2=22) would return true.
Return Type	Boolean
Return Description	True/False

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression
Exemplar	String	string representing a mathematical expression of an exemplar
Simplify	Boolean	Flag indicating that simplifications can be performed (e.g. 1+1=2)

### EXPRESSIONCONTAINS

Custom Operator	Description
Function Name	EXPRESSIONCONTAINS
Function Description	Determines if a given math expression object contains a given substring
Return Type	Boolean
Return Description	Returns true if the substring is found in the given math expression

Attributes	Type	Description

Attributes	Type	Description
object	identifier	Identifier referencing a string representing a mathematical expression
string	String	Substring that we are looking for

## EVALUATE

Custom Operator	Description
Function Name	EVALUATE
Function Description	Converts expression to floating-point approximation (decimal number)
Return Type	Float
Return Description	A decimal number that represents the expression or Double.NaN if it cannot be parsed.

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression

## GETEQUATIONSCOUNT

Custom Operator	Description
Function Name	GETEQUATIONSCOUNT
Function Description	Determines the number of equations in a math expression object
Return Type	Integer
Return Description	An integer count of the equations in the input math expression object

Attributes	Type	Description
object	identifier	identifier referencing a string representing a mathematical expression

### Example Grid Rubric (Type = GRAPHIC)

This section provides an example of a SmarterApp Grid item rubric that contains CTRL and GETSELECTEDREGIONSCOUNT custom operators.
